**ESTABLISHMENT REPORT FOR THE 1996 DOUGLAS FIR SEED SOURCE
TRIALS AT SEVEN SITES.**

EXECUTIVE SUMMARY

During 1996 seven Seed source trials were established under Work Plan 2600 for the Douglas fir Breeding Cooperative, using seedlings grown from seed collected from California and Oregon in 1993 by C.B.Low and M.A.Miller (Low and Miller, 1994), and collections from all significant New Zealand Seed stands.

INTRODUCTION

Seed source trials for Douglas fir have been planted before(in 1971 and 1974), but these did not contain good coastal Californian seedlots, and the NZ seed stands of Californian origin were not in production at the time. With the estate of Douglas fir in New Zealand currently expanding, a number of factors recently combined to initiate a further series of seed source tests under the Douglas fir Cooperative. The factors were as follows :-

1. Seed collections had been just been made(1994) in all of the significant New Zealand seed stands
2. Seed was available from some coastal Californian seed orchards that had just come into production(1992/1993)
3. Seed from previously untested coastal California provenances was available
4. New classes of land are available for the large scale planting of Douglas fir
5. Weyerhaeuser were interested in trialing 12 seed orchard progenies on New Zealand sites

During 1996 seven genetic gain type trials were established under Work Plan 2600 for the Douglas fir Breeding Cooperative, using seedlings grown from seed collected from California and Oregon in 1993 by C.B.Low and M.A.Miller (Low and Miller, 1994), and collections from all significant New Zealand Seed stands.

OBJECTIVES

1. To test commercially available seedlots and Southern Californian provenance seedlots of Douglas fir on a variety of sites, from "typical" Douglas fir sites to "harsh" sites(Seedlots listed in Table 1).
2. Genetic gain comparison between seedlots in current use.
3. Provide for growth plot installation for long term information.

Table 1. SEEDLOT CODES (* denotes seedlots for big blocks)

Code	Seedlot	Source	Origin	seed zone	Latitude	Type of seed collection

† seedlots planted at Tauhara only, see appendix I for makeup

DESIGN

Randomised complete block design

10 replications

33 seedlots per replication

3 x 11 rows of 5-tree row plots per replication

spacing 3 x 3m (1111 stems per hectare)

Two replications of three New Zealand seedlots as 49 tree plots(for long term yield studies)

SITE ACQUISITION

The process of acquiring and laying out of the trials began in January with a request made to Co-operators for suitable uniform sites, in the regions nominated by the Cooperative. All prospective sites were visited and the best of those offered were put on a 'short list' for approval by Cooperative members

FIELD LAYOUT

A sufficient number of replications was laid out using a theodolite and measuring tape, leaving out areas of the site which appeared to be significantly different from the rest of the site. Replications were demarcated with numbered 2" x 1" treated stakes in each corner. A rough map of the trial was drawn then taken back to NZFRI and a copy made using Autodesk's 'AUTOSKETCH'.

NURSERY SEEDLING SURVIVAL COUNTS/LABELLING

During April 1996 seedling survival was assessed to determine if sufficient seedlings of each family had grown to allow the trials to be established according to the workplan design. The survival counts showed that while most seedlots had produced sufficient seedlings, there would need to be some adjustments to seedlots by site to ensure all seedlots were tested on at least one site.

TRIAL LIFTING

Lifting and sorting of each trial was begun in the week before field establishment. Where a seedlot fell short of the 50 plants required for site, the seedlot was made up to the nearest replication,(eg 40 plants = 8 reps), and another seedlot (Code 908) substituted for the remaining replications.

TRIAL ESTABLISHMENT/PLOT MAPPING

The trees were transported to the site where an experienced silvicultural gang supplied by the co-operator who owns the site was used to plant the trial. Trial planting proceeded thus :

The appropriate bag of trees was brought to the pegged plot about to be planted. Bundles of five trees were given randomly to the planters.
Planting strings guide planters to produce accurate planting spacing, (3m x 3m).
Map position of seedlots after the plot is planted.
Repeat until all plots planted.

SITES PLANTED

FR281/1 Cpt 247 Golden Downs Forest, Fletcher Challenge Forests Ltd

FR281/2 Cpt 521 Tauhara Forest, Fletcher Challenge Forests Ltd

FR281/3 Cpt 13 Hanmer Forest, Carter Holt Harvey Ltd

FR281/4 Cpt 8/15 Waipouri Forest, City Forests Ltd

FR281/5 Ribbonwood Station, NZFRI, Colin McKai

FR281/6 Cpt 746 Gowan Hills, Earnslaw One Ltd (6 replications only)

FR281/7 Cpt 27 Beaumont, Earnslaw One Limited (6 replications only)

A description of each site is provided in appendix II

CONCLUSION

The trials were successfully established. Some of the planting stock used could be considered as small when compared to normal planting stock, but given that it is likely that many of the Californian seedlots have some degree of inbreeding, a wide range of plant vigour could be expected.

Breeding strategy

* Morning → company → results from trials

→ 1971 → 268 → 1990 → poly + diallel

Afternoon → trials visit.

880's → sustainable

→ { 268's } → trial gone
→ { 1971 trial }

2nd day

fred's clones

* fletcher's clones (95, 96 plating)

268's trial

704

Strategies for future

1 268 → resurrect diameter ; branching , cores → juvenile - mature

2 850 → diam and density taken (3 cores per tree) / check for map of diallel -

3 880's → next september thinning to 1 ind per family bark windows for age 8.

The Impact of Harvesting Radiata Pine on site Productivity in Golden Downs Forest

Introduction

The sustained high productivity of New Zealand's managed forests will depend upon maintenance of soil fertility. Just as site productivity can be increased by operations such as fertilisation, so it can be decreased by operations such as harvesting that remove nutrients and change the physical structure of the soil. To address this a series of trials has been established throughout NZ on various soil types. The trial in Golden Downs Forest is second rotation, and as with the Kinleith trial, it includes a genetic component.

Site characteristics

Location:	Between Kings and Blue Glen Roads in Golden Downs Forest on the way to Motueka Gorge; about 21 km south of Belgrave
Elevation:	450 m above sea level.
Soil type:	Spooner Hill Soil

Objectives

1. To determine the effect of harvesting and site preparation on a major soil type in Golden Downs Forest on short- and long-term site productivity.
2. To determine if harvesting intensity is negatively correlated with succeeding forest growth.
3. To determine if the reasons for a negative correlation are nutritional.
4. To determine the relative performance of improved radiata pine families as affected by intensive harvesting and site preparation.
5. To provide information for management recommendations that will sustain productivity in the forest estate.

Trial establishment

The first rotation of *P. nigra* was clear felled in 1994 at age 45, with the retention and removal of different amounts of organic matter. To reduce the confounding effects of compaction, harvesting machinery was prohibited on the plots, and organic matter was removed manually. The trial was planted in July 1994 with a selection of 47 open-pollinated "880" series families plus three controls of *P. radiata* plants of 1/0 at 2500 stems/ha-1. Two seedlings of each family were planted in each split-plot at 2m * 2m spacing. Main treatments (replicated 4 times) examine the effects of harvesting intensity or organic matter removal (plots are 80m * 40m).

Main treatments:

- FF Whole tree removal and forest floor removal
WT Whole tree removal
SO Stem only removal

Split-plots examine the effect of fertiliser additions (plots are 40m * 40m; with 20m * 20m inner measurement plots). The following fertiliser was applied as an initial application in October 1994 to the +f split-plots: 50 kgN/ha as urea; 50 kgP/ha as NCRock; 50 kgK/ha as KCl; 8 kgB/ha as ulexite; and 100 kgMg/ha as calmag. From January 1995 urea has been applied quarterly at the rate of 50 kgN/ha to the +f split-plots. Tasman

Forestry Limited, Fletcher Challenge Forests, and Weyerhaeuser Company have provided total weed control. Table 1 summarises work to date.

Table 1. Golden Downs (FR220) summary of events

Event	Dates
First rotation established	1949 <i>P. nigra</i>
Initial assessment	10-12/93 measurements, biomass, litter, soil by depth to 60 cm, BD. 10/94 post-harvest debris sampled
Establish plots	9/93 (pre-harvest, forest floor removal by hand), 5/94 (debris removed by hand)
Harvest	2/94
Plant	7/94
Soil densimeter	1993 pre-harvest
Weed control	7/95 aerial Velpar 1/97 aerial Velpar @ 4 kg a.i./ha autumn/97 hand-cutting & spraying of woody weeds
Measurements: height, RCD	10/94, 8/95, 6/96, 9/97
Measurements: height, DBH	9/97, 5/98
Foliage sample (primary)	individual trees: 3/96
Foliage sample (secondary)	plots: 2/97, 3/98 individual trees: 2/97, 3/98
Foliage contents	3/98
Fertilise urea 50 kg N/ha	10/94, 1/95, 5/95, 8/95, 11/95, 3/96, 6/96, 9/96, 12/96, 2/97, 9/97, 12/97 3/98
Fertilise NCRock 50 kg P/ha	10/94
Fertilise KCl 50 kg K/ha	10/94
Fertilise ulexite 8 kg B/ha	10/94
Fertilise calmag 100 kg Mg/ha	10/94
