Forest Research /INDUSTRY RESEARCH COOPERATIVES

EXECUTIVE SUMMARY

This workplan is intended to update a group of workplans covering various projects and tasks into a single cohesive workplan. The objectives are to:

- To ensure that trials supported by the Stand Growth Modelling Cooperative (SGMC) are maintained and remeasured up to a minimum 30 years.
- To quantify genetic gain in growth and yield of Radiata pine with increasing genetic worth through measurements of established PSPs.
- To allow the assessment of stem and wood quality attributes at clearfell in respect to site, silviculture and genetics.

The revised SGMC Research Strategy (Feb 2001) is for measurements in these trials to focus on growth and quality aspects, with the data representing both site, stocking and planting stock. Data from this complete series will contribute to all themes and projects of the SGM Cooperative.

This document includes a list of all plots established in the 1978-1984 Genetic Gain Trials, the 1987-1991 Silviculture/Breed Trials and the 1992 and 1994 Special-Purpose Breeds Trials. Detailed plot location maps describing treatments and seedlots are included in Appendix 1.

**WORKPLAN for TRIALS with
GENETICALLY IMPROVED RADIATA PINE
PLANTED between 1978 and 1994**

Objectives:

- To ensure that trials supported by the Stand Growth Modelling Cooperative (SGMC) are maintained and remeasured up to a minimum 30 years.
- To quantify genetic gain in growth and yield of radiata pine with increasing genetic worth through measurements of established PSPs.
- To allow the assessment of stem and wood quality attributes at clearfell in respect to site, silviculture and genetics.

Introduction:

Between 1978 and 1980, the Genetics and Tree Improvement group (GTI) planted a series of Genetic Gain trials throughout the country for the purpose of providing demonstrations of gains from tree improvement research, as well as, relative rankings of seedlots from differing seed orchards. In 1986, permanent sample plots (PSPs) were established and assessed in a subset of seedlots and sites in this trial series. This included GF7 and GF14 seedlots in all plantings and a GF8 (long internode seedlot) in the 1979/80 plantings. In 1991, additional PSPs were established and assessed to include the GF2 and GF22 seedlots in the 1978 plantings.

GTI planted another trial at one site (Kaingaroa) in 1984 to test seedlots that approximate the composition of seed from future orchards. PSP plots were first established at this site in 1990.

Between 1987 and 1991, another series of trials (Silviculture/Breed) were planted to test the response of improved breeds at varying levels of final crop stocking and site quality. PSP plots were first established in 1992. In 1992 and 1994, a further series of Special Purpose Breeds trials were planted to test the response to variations in stand density and compare the performance across regions. PSP plots were first established in 1999 and will continue to be established in 2000/01.

PSPs in all these trials, now under the umbrella of the Stand Growth Modelling Cooperative, are categorised into three groups: Genetic Gain; Silviculture/Breed; Special-Purpose Breeds. The trial designs are well documented in SGMC Report No.100 (Hayes, 2001).

This workplan is intended to update a group of workplans covering various projects and tasks into a single cohesive workplan.

A list of the previous workplans is as follows:

SGMC Category	Workplan No.	Date	Purpose
Genetic Gain	20212	1978	Planting seed orchard stock from controlled pollination to predict performance of future seed orchards
	20284	1983	Evaluate genetic improvement from orchard seed and cuttings produced by the radiata pine breeding programme
	1448	1986	Establish and assess growth plots in trials planted 1978-80
	2071	1991	Establish and assess plots in additional seedlots in trials planted 1978-80
	2297	1994	To broaden the range of silvicultural regimes with genetic comparisons in the 1984 Genetic Gain trial
Silviculture / Breed	1585	1987	Test the response of improved breeds at varying levels of final crop stocking and site qualities
	1633	1988	Test the response of improved breeds at varying levels of final crop stocking (silvicultures) and site qualities
	1633 Addend.	1989	As above, but with variations in seedlots, nursery sources and silviculture treatments
	1633 Addend.	1990	As above, but to extend the range of bio-geoclimatic regions
	1980	1991	Establish a comprehensive range of trials comparing genetically improved Radiata pine
Special-Purpose Breeds	2151	1992	Establish special-purpose breeds trials to measure performance of wood density and uninodal breeds across regions
	2295	1994	Establish special-purpose breeds trials to measure performance of wood density and uninodal breeds across regions

The PSPs established in these trials have been managed and supported by the Stand Growth Modelling Cooperative since 1986 with the following objectives in mind:

- to quantify the increase in yield with genetic improvement,
- to validate the ability of existing models to predict yield of improved stock,
- to establish the relationship between increase in yield and GF rating, and
- to be utilised for measurements of stem form to identify external characteristics (e.g. PhotoMARVL) and/or any other measurements as seen appropriate in the future.

Research Strategy:

Prediction of forest growth is an integral part of sound forest management. It is important that growth models accurately predict growth of genetically improved seedlots.

In the late 1980's, the existing growth models were based principally on data from stands planted with unimproved seedlots. Data collected from a limited range of resources indicated that improved radiata breeds grew faster relative to unimproved radiata. There was a requirement for growth models to be modified to account for this genetic gain. At that time, the 1978-80 genetic gain trials represented a substantial proportion of the information which could be collected on 'older' genetically improved trees, and in particular, were the only trials where information was available on seedlots less than GF7 and greater than GF18.

The Stand Growth Modelling Cooperative Research Strategy (1998) said that:

- the genetic gain trials would provide data on the long-term growth trends of genetically improved radiata pine breeds for research into the effects of genetic improvement and for developing growth modelling methodology.
- The data would be used to review and update the estimates of the growth rate genetic gain multipliers for growth models as more data becomes available.

The objectives were revised in the Stand Growth Modelling Cooperative Research Strategy (2001) to include a theme on Data Provision, to ensure that:

- The necessary data are available to all other themes with respect to modelling the effects of site, stocking and planting stock on growth.

SGMC Long Term Trials:

Support of trials designed to quantify growth and yield gains from improved radiata pine (see SGMC Report Nos. 24, 40, 70 and 100) has been on-going and substantial from the inception of the SGM Cooperative in 1986. PSPs in these trials represent a wide range of regions and sites, as well as, comparisons among seedlots and silvicultural treatments. Detailed trial maps for all sites showing plot orientation, seedlots and treatments are included in Appendix 1.

The design of the trials falls into three categories:

1. Genetic Gain - plots superimposed on large-block trials (1978-80, 1984) with many replications on a few sites.
2. Silviculture/Breed - trials designed with a wide range of spacing treatments (1987-91) planted specifically for the provision of genetic gain data for growth models, known as Silviculture/Breed trials; block plots with few replications on many sites.
3. Special-purpose Breeds - trials designed with two treatments and many replications over a range of seedlots to measure performance of wood density and uninodal breeds (1992 and 1994).

PSPs have been superimposed on the large-block Genetic Gain trials (Table 1), current plots now totalling 239 over seven forests – Aupouri, Kaingaroa, Mohaka, Golden Downs, Waimate, Longwood and Dean.

The Silviculture/Breed trials, designed experiments with stocking treatments, have been planted on 28 sites, between 1987 and 1991. Seedlots with up to GF25 are represented, including long internode seedlots. PSP plots have now been established at 27 sites (Hokonui Forest was abandoned) with a total of 844 current plots (Table 2).

The Special-purpose Breeds trials (Table 3), have been planted on 8 sites and represent seedlots up to GF30, low and high wood density and uninodal breeds, with a total of 241 plots. One site at Riverhead Forest has been abandoned.

In 1999 new proposals were accepted for revision of the remeasurement schedule to help in the rationalisation of time and cost in the ‘long-term trials’ remeasurement programme.

The following rules were agreed, that:

- 1975 trials be removed from the genetic gain work programme
- 1978-80 trials will be on a two yearly remeasurement schedule from age 20 years
- 1984 trial will be measured every two years from 2001
- 1987-91 Silviculture/Breed trials will be measured every year for 4 years after plot establishment, then every two years, with the exception of any late silviculture. After silviculture, trials will be measured annually for 3 years, then return to a two yearly schedule.
- 1992 and 1994 Special-purpose Breed trials will be measured every year for 4 years after plot establishment, then every two years.

In 2001, it was agreed that plots thinned to 100spf in Silviculture/Breed series will be abandoned at some sites due to the severity of undergrowth problems (gorse and blackberry), poor form caused by wind damage in the open grown plots and the time involved in remeasuring. Sites included are Tahorakuri, Tungrove, Kinleith, Tairua, Otago Coast and Ashley Forests. Data from this treatment have not been used in any analysis to date.

Using the above rationale, the current remeasurement programme was revised and the projected numbers of plots to be measured until 2004 is shown in Table 4.

It should be noted, that, the 1978-80 trial series encompasses some of the oldest trials and growth data from seedlots over GF18 and have been well designed to allow direct comparisons of growth between seedlots and sites, and for the development of growth models.

Future:

The revised SGMC Research Strategy (Feb 2001) is for measurements in these trials to focus on growth and quality aspects, with the data representing both site, stocking and planting stock. Data from this complete series will contribute to all themes and projects of the Stand Growth Modelling Cooperative. Plots were established in these trials for 'long-term' research and it is required that the plots continue to be measured until age 30 years (to be known as full rotation), even though not all plots will be measured every year. Given the current value of the data from these trials (the GF22 seedlot is the oldest block planting in New Zealand), it is essential that the trials be retained to allow measurements through to age 30. Landowners will attempt to preserve these trials to a minimum of 30 years with the following conditions:

- The landowner gives the SGMC ‘an intent to clearfell’ 2 years prior to the event if clearfell is to occur prior to age 30.
- If the land around or near the trial is to be clearfelled then a ‘clearfell buffer’ of a minimum of 80m is required.
- The landowner endeavours to take all reasonable steps to retain the trial for 30 years.

Future use of the existing trials will include:

- Investigation of:
 - branching, straightness and form acceptability (GTI assessments)
 - stem shape
 - genetic effects as well as site, stocking and health effects
 - crown architecture
- Provision of source trees, with a known history, for quantification of any other properties as required in the future
- Objective measurements of external stem characteristics (e.g. PhotoMARVL)

Responsibilities:

PSP establishment	- Dean Duyvesteyn
Annual remeasurement	- Dean Duyvesteyn
Data storage	- Judy Hayes
Trial records	- Judy Hayes
Management and Analysis	- Bob Shula, Judy Hayes, Jenny Grace
