REPORT No 40.

JUNE 1995

- N.B. This addendum replaces all Tables and Appendices in Stand Growth Modelling Cooperative Report No. 24 and No 24a.**

FRI/INDUSTRY RESEARCH COOPERATIVES

EXECUTIVE SUMMARY

Stand Growth Modelling Cooperative Report No. 24 (October 1991) outlined the permanent sample plots in genetic trials being supported by the Cooperative. Details of trial design, including experimental design, silviculture and seedlots were presented in a series of Tables and Appendices. Report No 24a (March 1994) documented modifications and corrections which were made between 1991 and 1994.

This report gives another updated overview of all trials supported by the Cooperative and documents current plans for these trials, establishment information to date and modifications in trial designs since previous reports. It presents a comprehensive summary of the status of all trials and permanent sample plots as of June 1995.

This addendum replaces all Tables and Appendices in Stand Growth Modelling Cooperative Report No. 24 and the 1st revision, Report No. 24a.

1. INTRODUCTION

Measurement and establishment of permanent sample plots (PSP's) has progressed on schedule since issue of Report 24a. However, some further modifications have been desirable and are noted in this report. Documentation of the current status for each trial is presented in a set of Appendices 1-30 (an update of Stand Growth Modelling Cooperative Report No. 24a). In addition, appropriate tables from Report 24 have been updated and are included in this report. Representation of PSP plots in the framework for a 'core' PSP growth database for each growth modelling region, outlined in Section 3, is also included.

2. OVERVIEW OF COOPERATIVE TRIALS

PSPs in genetic gain trials represent a wide range of regions and sites, as well as valid statistical comparisons among seedlots and silvicultural treatments. The silviculture/breed trials have been planted to represent a matrix of site qualities, regions, breeds and treatments (Table 1).

The trial design of this series falls into two categories:

- Plots superimposed on existing trials (Tables 2a, 2b & 2c).
- Plots designed with a wide range of spacing treatments, planted specifically for provision of genetic gain data for growth models (Tables 3a & 3b).

A summary of the site categories and GF ratings of seedlots represented in all of the trials is presented in Table 4. The silviculture, planting stock and measurement information is detailed for each trial in Appendices 1-30.

The statistical analysis ANOVA tables (Appendices 23-29 in Report 24a) have not been redone to accommodate the changes made to the silviculture/breed trials. These tables will be reviewed when data analysis begins.

3. FRAMEWORK FOR A 'CORE' PSP GROWTH DATABASE

Permanent sample plots provide data to form a robust growth modelling response surface.

The PSP Future Strategy Report (Hayward, et al., 1991) sets down a framework for a PSP database which is intended to provide the 'core' information for growth modelling for each defined site class over a range of different silvicultural options. The currently defined growth modelling regions can be considered as aggregations of forests with similar site qualities, consequently these regions can be defined as one such site class.

Full documentation of each growth modelling region, by initial stocking class, is presented in Tables 5-12. The coverage of plots within this matrix was previously documented in Report 24a for the Central North Island growth modelling region only. The Cooperative trials only represent three of the initial stocking ranges; <500, 500-900 and 900-1800 stems/ha. The matrix representing plots with an initial stocking greater than 1800 stems/ha was not represented. Table 13 shows the categories which are included in this core framework.

The GF rating, the number of plots, the location of plots, and their position in the matrix of silvicultural options is provided for, again including the Central North Island, the following regions:

Auckland Clays	- Tables 5a-5c.
North Island Sands	- Tables 6a-6c.
Central North Island Pumice Plateau	- Tables 7a-7c.
East Coast	- Tables 8a-8c.
Hawkes Bay	- Tables 9a-9c.
Nelson	- Tables 10a-10c.
Canterbury	- Tables 11a-11c.
Southland	- Tables 12a-12c.

These tables show that while the Cooperative PSP plots do not provide a comprehensive coverage of all options included in the matrices, a relatively wide range is represented for most regions.

4. MODIFICATIONS IN COOPERATIVE TRIALS

Changes in Silvicultural Treatments

Two additional treatments have been added to Silviculture/breed trials FR77 and FR78. These trials originally had three replications of each treatment (pruned and thinned from 500 stems/ha to 400 and 200 stems/ha). Two additional silvicultural treatments have been added with one replication in each, by reducing the number of replications of the original treatments from three to two;

- 1) unpruned and unthinned
- 2) pruned with a late thinning to 200 stems/ha at 20m MCH.

This is documented in Appendices 20 and 21.

Changes in Measurement Schedule

In order to minimise the cost of re measurement but maximise the pool of genetic gain data available, it has been decided that all trials will receive annual re measurements up to and including age 20, followed by 2/3 yearly re measurements. The projected work programme to the year 2000 (Table 14) shows when these new schedules begin and how they affect the time required for re measurement.

The initial stocking trial, RO 972, planted in 1970 and the 1975 planted 850 Polycross trials will be measured in 1995/96 financial year followed by three yearly re measurements. The 1978 planted Genetic Gain trials will be measured annually up to 1998/99 and then put on a two yearly re measurement schedule.

Unscheduled Silvicultural Treatments

Treatment 6 (pruned with a production thin at 20m MCH) no longer exists in the two Silviculture/breed trials FR8 (Tahorakuri) and FR10 (Glengarry). Eight plots at each trial were thinned in error at plot establishment (MCH 6.2m), which means these plots are now equivalent to Treatment 2 (Appendices 11 and 13).

The Silviculture/breed trial FR8, was given an unscheduled 2nd prune by Tasman Forestry staff. All trees in the pruned plots were given a variable height prune to leave 4m of crown (Appendix 11). The average prune height of the pruned plots is now 4.5m. A plot (treatment 5a) which was to have been unpruned was also pruned in error by Tasman Forestry staff.

In addition, unscheduled thinning of two 'core' plots in trial FR8 occurred during the regeneration cutting before plot establishment (Appendix 11). One plot (treatment 4a) was thinned to 400 stems/ha instead of 600 stems/ha. The other plot (treatment 3a) was thinned to 500 stems/ha. This plot was thinned to 400 stems/ha at the time of plot establishment as per the original plan.

Plots abandoned or not established

Several plots in the Silviculture/breed trials did not have PSP plots established or they were abandoned at a later stage for various reasons. The following trials have been affected:

Trial	Location	No. Plots	Reason for Abandonment
FR 11	Ditchlings	1	unusual spacing and mortality problem
FR 11	Ditchlings	1	trees felled after establishment due to power lines
FR 12	Otago Coast	1	not established, unable to distinguish plot trees
FR 56	Dalethorpe	1	unusual spacing and mortality
FR 56	Dalethorpe	5	poor tree quality and mortality
FR 57	Tikokino	2	high mortality
FR 77	Tikokino	1	unable to locate plot trees
FR 78	Gwatas	12	high mortality (root trainer and directly planted field cuttings had a very low survival rate)

Full details of these plots are documented in their respective appendices.

Trials Abandoned

Three trials, FR58, FR59 and FR60 have been abandoned, in 1995, as part of the Cooperative trial re measurement programme. These trials do not have any genetic comparison, therefore they are unsuitable for genetic gain analysis. The trials may continue to be measured for inclusion in a pool of general growth data for growth modelling improved breed Radiata stock.

Alteration of treatment numbers

Silviculture/breed trial FR55 (Eyrewell) has had the original treatment numbers reallocated to a more logical sequence for establishment and numbering of PSP plots (Appendix 18).

Late Thinning Treatments

There are twelve trials with plots requiring a late thinning. These will be carried out, at the appropriate time, by FRI staff.

In order to standardise the size of trees and emulate a production thinning, all late thinnings have been scheduled for a MCH of 20m. The 1984 initial stocking trial (RO1897) schedule has been changed from an 18m MCH, the 1987 and 1988 silviculture/breed trials have been changed from 20-25m MCH, and two 1989 silviculture/breed trials (FR84 & FR85) changed from 12-14m MCH.

The first of these thinnings is estimated to be due in 1997. Table 14 schedules the late thinnings required, giving an estimated date of thinning. This will need to be revised after each annual re measurement using the current age and MCH.

5. WORK PROGRAMME FOR COOPERATIVE TRIALS

A work programme (Table 15) for all the Cooperative trials, projects the input required for re measurement and establishment for the years 1994 to 2000. The manweeks of work include those for NZFRI staff only. Numbers do not reflect 'in kind' contributions of industry field staff. The current table shows that input required from FRI will reach a plateau of around 75 manweeks in 1997/98.

This table will be reviewed following the measurement season each year and adjusted where necessary to reflect the actual time taken in the previous season.

6. PROCEDURES FOR PSP PLOT ESTABLISHMENT

Standard methods (Ellis et al., 1991) are used for establishment and annual re measurement of PSP plots unless otherwise specified in establishment Reports.

A full establishment report (Skinner, Dunlop, Carson; 1994) for the 1987 planted Silviculture/breed trials has been completed. Further such reports, by planting year, will be completed when plot establishment is complete for each group of trials. Reports are in progress for the 1988 and 1989 plantings.

The following procedures are standard for establishment of the silviculture/breed plots:

- 1) Plots not requiring pruning and thinning are surrounded with flagging tape.
- 2) Pruning (to leave 4m crown remaining) is carried out by a contract gang organised by the forest owner concerned and supervised by FRI Mensuration field crews.
- 3) PSP's are established under the direction of FRI Mensuration field crews, who check that the correct number of trees have been pruned and will remain after thinning. At establishment DBH of all trees is measured, and total height, and if applicable, pruned height, DOS, DOS height and maximum branch diameter of twelve selected height trees.
- 4) Plots that require thinning are thinned immediately following plot establishment by FRI Mensuration field crews.
- 5) PSP's are measured annually up to and including age 20 (Table 15) under the direction of FRI Mensuration field crew.

At an annual re measurement, measurements are taken of DBH for all trees and total height and crown height for the twelve selected height trees (this includes the four predominant height trees). Trees are coded for any damage or irregular form.

6	"	1500	750	500	250	6.2	8.2	12	6:1	••	••		

- 1) Sixteen PSP's established 1975. Data available: Height and diameter annually 1975-1983, then biannually from 1985-1995, 3 yearly thereafter.
- 2) Cuttings from older trees (probably about 8-9 years old) of uncertain breed, probably unselected.

APPENDIX 2

Experimental design for randomised complete block Final Crop Stocking Trial planted in 1975 (as GTI "850 Polycross" trial) at Woodhill (AK1056), Kaingaroa Cpt 327 (RO2098), Golden Downs (NN529) and Eyrewell (CY597).
 Each dot represents one large plot with a PSP.¹⁾

Trt	Pruning	Silviculture				Planting stock		
		Stocking (stems/ha)	Initial	Final	MCH (m)	Thinning	Ratio	GF13 (approx.) ²⁾

6	"	625	200	20	3.1:1	•••		
7	"	625	400	20	1.6:1	•••		

- 1) Twenty four PSP's established at each site in 1986. Data available: Height and diameter annually 1986-1994, biannually thereafter.
- 2) Single-tree-plot progeny trial consisting of offspring from 100 mothers (most are "850" series selections from both the North and South Islands) crossed with a pollen mix of 10 North Island "850" series parents. Seedlot C72/654 at Woodhill, Nelson and Canterbury. Seedlot R72/927 at Kaingaroa.
- 3) 200 stems/ha treatments pruned to 6 m at Kaimaroa (RO2098) and Golden Downs (NN529).

APPENDIX 3

Experimental design for randomised complete block 1978 Genetic Gain Trial (sawlog regime) planted in 1978 at Aupouri (AK1058), Kaingaroa Cpt 1210 (RO2103/1), Mohaka (WN377), Golden Downs (NN530/2), Longwood (SD564/1) and Waimate (CY421/1).
Each dot represents one large plot with a PSP. 1/2

Trt	Pruning	Silviculture						Site	Planting stock				
		Stocking (stem/ha)			Thinning				GF2 (R74/1027)	GF7 4) (WN76/2/3)	GF14 (WN76/2/3)	GF22 (850-55x850-96)	
		Initial	Interim	Final	1st MCH	2nd MCH	Ratio

								Longwood	••• 2)	•••• 2)	•••• 2)	••• 2)	
								Waimate	••• 2)	•••• 2)	•••• 2)	••• 2)	

- 1) Twelve PSP's established 1986 at Aupouri, Kaingaroa, Mohaka and Golden Downs. Twelve PSP's established 1991 at Longwood and Waimate.
Data available:
AK1058, RO2103/1, NN530/2: Height and diameter annually 1986 to 1998, biannually thereafter.
WN377: Height and diameter annually 1986-1988, annually 1991 to 1998, biannually thereafter.
SD564/1, CY421: Height and diameter annually 1992 to 1998, biannually thereafter.
- 2) Six additional PSP's were established in 1991/92 at Aupouri, Mohaka and Golden Downs, and twelve additional at Kaingaroa (Appendix 3a).
Some plots had their centres moved in 1994 due to an establishment error (3 plots GDNS, 5 plots LONG, 2 plots MOHA and 1 plot WMTE).
- 3) Three additional seedlots (6 reps) are included on all sites in this experiment but are not being monitored with PSP's. They are:
GF10 (GF13 in Southland), CY/C/75/52, GF8 (GF14 in Canterbury), CY/C/75/51, GF16, FRI 76/2052
- 4) Local climbing select seedlots have been arbitrarily assigned a GF7. They are:
Kaingaroa climbing select R/76/01 at Aupouri (AK1058) and Kaingaroa (RO2103/1)
Ngaumu climbing select WN/C/75/15 at Mohaka (WN377)
Golden Downs climbing select NN/C/75/2 at Golden Downs (NN530/2)
Balmoral climbing select CY/C/75/40 at Waimate (CY421)
Rakleburn climbing select SD/C/75/27 at Longwood (SD564/1)

APPENDIX 3A

Plots established in the 1978 Genetic Gain Trials by year.

APPENDIX 4

Experimental design for randomised complete block 1978 Genetic Gain Trial (pulpwood regime) planted in 1978 at Kaingaroa Cpt 1210 (RO2103/2) and Longwood (SD564/2).
 Each dot represents one large plot with a PSP. 1/2)

Trt	Pruning	Silviculture			Site	Planting stock		
		Stocking (stems/ha)		Thinning		Seedlings 3)		
		Initial	Final	Ratio		GF2 (R74/1027)	GF7 4) (WN76/2/3)	GF14 (850-55 x 850-96)
1	2.2 m	711	711	1:1	Kaingaroa (RO2103/2)	••••• 2)	•••••	••••• 2)
					Longwood (SD564/2)	••• 2)	••• 2)	••• 2)

- 1) Twelve PSP's established 1986 at Kaingaroa. Data available: Height and diameter annually 1986-1998, biannually thereafter.
 Twelve PSP's established 1991 at Longwood. Data available: Height and diameter annually 1992-1998, biannually thereafter.
- 2) There were additional PSP's established in 1991/92. Some plots had their centres moved in 1994 due to an establishment error (5 plots Kaingaroa).
- 3) Three additional seedlots (6 reps) are included on all sites in this experiment but are not being monitored with PSP's. They are:
 GF10 (GF13 in Southland) - CY/C/75/52, GF8 (GF14 in Canterbury) - CY/C/75/51, GF16 - FRI 76/2052
- 4) Local climbing select seedlots have been arbitrarily assigned a GF7. They are:
 Kaingaroa climbing select R76/01 at Aupouri (AK1058) and Kaingaroa (RO2103/1)
 Rankleburn climbing select SD/C/75/27 at Longwood (SD564/2)

APPENDIX 5

Experimental design for randomised complete block 1979 Genetic Gain Trial planted in 1979 at Kaingaroa Cpt 1218
 (RO2103/3) and Golden Downs (NN530/1) and in 1980 at Dean (SD682).
 Each dot represents one large plot with a PSP. 1)

Trt	Pruning	Silviculture						Site	Planting stock					
		Stocking (stem/ha)		Thinning		GF7 2)	Seedlings		GF14 3)	GF14		(FRI78/2300)	L119 (GF8/2301)

					(m)	(m)								
1	2.2m, 4.2m, 6m	1111	600	300	6	12	3.7:1	Kaingaroa	•••••4)	5)	•••••6)	•••••4)	•••••4)	
								Golden Downs	•••••	5)	•••••6)	•••••	•••••	
								Dean	•••	•••••	•••••6)	•••••	•••••	

- 1) Twenty four PSP's established at Golden Downs and Dean, and twenty PSP's established at Kaingaroa in 1986. Data available: Height and diameter annually from 1986.
- 2) Local climbing select seedlots have been arbitrarily assigned a GF7. They are:
 Kaingaroa climbing select R76/01 at Kaingaroa (RO2103/3) and Golden Downs (NN530/1)
 Rankleburn Cpt 17 climbing select (SD/C/76/2) at Dean (SD682) (plots were established in the forest surrounding the trial).
- 3) Seedlot FRI78/2300 was reclassified from GF18 to GF14 (see Stand Growth Modelling Report No 35)
- 4) Three plots at Kaingaroa were abandoned in 1994 due to dothistroma mortality and poor form (group of plots planted in a hole).
- 5) Up to 6 replications of seedlot CY/C/75/51 are not being monitored at Kaingaroa (RO2103/3) and Golden Downs (NN530/1).
- 6) Seedlot FRI78/2299 (GF14) was found to be inbred and plots were abandoned in 1992 (last measured 1991).

APPENDIX 6

Silviculture and seedlot for Silviculture Comparison established in the Best Practices trial
 planted in 1982 at Riverhead (FR58).
 Each dot represents one large plot with a PSP. 1)

Trt	Pruning	Silviculture						Planting Stock			
		Stocking (stems/ha)			Thinning			1st MCH (m)	2nd MCH (m)	Ratio	Seedlings (3/3/80/2)
		Initial	Interim	Final							
1	250 stems to 3 m, 4.5 m, 6 m	1600	500	250	(age 6)	(age 7-8)	6.4:1	•••			
2	250 stems to 4.5 m	1600	1000	250	3	(age 6)	6.4:1	•••			

- 1) Six PSP's established 1988. Data available: Height and diameter 1988, 1989 and 1992-95. Access very poor due to weed competition. Trial taken out of the New/Breeds re measurement programme in 1995. No genetic comparison, therefore, unsuitable for genetic gain analysis.

APPENDIX 7

Silviculture and seedlot for Silviculture/Site Comparison established in "880" series progeny trial

planted in 1981 at Moerewa (FR59).

Each dot represents one large plot with a PSP. 1)

Trt	Pruning	Silviculture				Planting stock	
		Stocking (stems/ha)		Thinning		Seedlings	
		Initial	Final	MCH (m)	Ratio	GF16 (approx.) 2)	
1	2.2 m, 4.2 m, 6 m	816	350	(age 8)	5.1:1	•••3)	
2	2.2m	816	816	-	1:1	•••4)	

- 1) Six PSP's established 1988. Data available: Height and diameter annually 1988-92 and 1994. Trial taken out of the New/Breeds re measurement programme in 1995. No genetic comparison, therefore, unsuitable for genetic gain analysis.
- 2) Single-tree-plot progeny trial consisting primarily of approximately 170 open-pollinated offspring from "880" series ortets. Ortets are in the "268" series progeny trial planted at Kaingaroa Cpt 1350. See GTI Work Plan 185 for details.
- 3) Medium Site Index site.
- 4) Low Site Index site.

APPENDIX 8

Silviculture and seedlot for Final Crop Stocking Comparison established in the 268 x 875 Paircross progeny trial planted in 1982 at Weiti Station (FR60).
 Each dot represents one large plot with a PSP. 1)

Trt	Pruning	Silviculture			Planting stock		
		Stocking (stems/ha)		MCH	Ratio	Seedlings	
		Initial	Final			Thinning	
1	2.2 m, 4.2 m, 6 m	625	100	(age 6)	6.3:1	•••	
2	"	625	200	(age 6)	3.1:1	•••	
3	"	625	300	(age 6)	2.1:1	•••	
4	"	625	400	(age 6)	1.6:1	•••	

- 1) Twelve PSP's established 1988. Data available: Height and diameter annually 1988-1994. Trial taken out of the New/Breeds re measurement programme in 1995. No genetic comparison, therefore, unsuitable for genetic gain analysis.
- 2) Single-tree plot progeny trial consisting primarily of 128 crosses of "268" series x "875" series parents. See GTI Work Plan 22 for details.

APPENDIX 9

Experimental design for randomised complete block 1984 Genetic Gain Trial planted in 1984 at Kaingaroa Cpt 327 (RO1897).
Each dot represents one large plot with a PSP.1)

Trt	Pruning	Silviculture		Thinning 4)		Planting stock 3)						Cuttings 5)		
		Initial	Final	MCH (m)	Ratio	GF7 (FRI79/2320)	GF14 (3/3/83/2)	GF16 (9/0/83/91)	GF17 (9/0/83/96)	LI25 (GF11) (approx.) (9/0/83/99)	LI20(GF10) (approx.) (9/0/83/95)	B	GF16 (approx.)	Hc
1	2.2m	700	300	11.7	2.3:1	•••	••• ²⁾	•••	•••	•••	•••	•••	••• ²⁾	•••
2	"	700	400	11.7	1.8:1	•••	••• ²⁾	•••	•••	•••	•••	•••	•••	•••
3	"	700	300	20	2.3:1	••	•• ²⁾	••	•• ²⁾	••	••	••	••	••
4	"	700	400	20	1.8:1	••	•• ²⁾	••	••	••	••	••	••	••

- 1) Fifty four PSP's established 1990. Data available: Height and diameter annually from 1990.
- 2) Twelve additional PSP's were established in 1991: ten in GF14, one in GF17, and one in the GF16 cuttings. Data available: height and diameter annually from 1991.
- 3) Four additional types of planting stock are included in this experiment but are not being monitored with PSP's. They are:
 LI27(GF7) 9/0/83/98 - seedlings (10 reps)
 GF7 Cuttings from Kaingaroa climbing select 1 year old seedlings, FRI79/2320, in FRI nursery (2 reps)
 GF16 (approx.) Cuttings from 1 year old seedlings planted for progeny testing from open-pollinated mother tree collections made in Kaingaroa seed orchard ("880" parents) (2 reps)
 GF16 Cuttings from 4 yr old trees in "875" diallel progeny tests at Kaingaroa Cpt 327 and Onepu (10 reps)
- 4) First thinning treatment (11.7m MCH) carried out in March 1993.
 Second thinning treatment (20m MCH) expected to be carried out in summer 1997.
- 5) Cuttings were from 3-year-old plants collected in GTI's 268 x 875 ESSO trial at Kaingaroa Cpt 1132

APPENDIX 10

Experimental design for randomised incomplete block Silviculture/Breed Trials planted in 1987 at Woodhill (FR7).
Each dot represents one large plot with a PSP 1).

Trt	Pruning	Silviculture				Planting stock					
		Stocking (stems/ha)		Thinning		GF7 (79/2320)		GF14 (3/3/85/1)		GF19 (2/6/86/29) or (2/3/87/27)

12	Best 320 s/ha	1200	320	6.2	3.75:1	•					

- 1) Fifty four PSP's established December 1992. Data available: Heights only, age 2, pruning measurements 1992, height and diameter annually from 1993.
PSP establishment and silviculture is documented in Stand Growth Modelling Cooperative Report 32.

APPENDIX 11

Experimental design for randomised incomplete block Silviculture/Breed Trials planted in 1987 at Tahorakuri (FR8).
Each dot represents one large plot with a PSP 1).

8a	400 stems to 2.2m		1000	-	400	6.2	2.5:1	•	•	•	•	•

1) Fifty four PSP's established March 1992. Data available: Heights only, age 1, pruning data 1992, height and diameter annually from 1992.

PSP establishment and silviculture is documented in Stand Growth Modelling Cooperative Report 32.

2) An unscheduled 2nd prune was carried out by local staff at 9.0m MCH in October 1993.

3) Treatment 6 was originally a production thin (at 20-25m MCH) but was thinned in error at plot establishment, now equivalent to treatment 2.

4) First pruning to 2.2m at 9.0m MCH in October 1993.

5) An unscheduled interim thinning was carried out by local staff during the regeneration cutting operation in 1991.

APPENDIX 12

Experimental design for randomised incomplete block Silviculture/Breed Trials planted in 1987 at Kaimaroa Cpt 481 (FR9).
Each dot represents one large plot with a PSP 1).

- 1) Fifty four PSP's established February 1992. Data available: Heights only, age 2, pruning measurements 1992, height and diameter annually from 1992.
PSP establishment and silviculture is documented in Stand Growth Modelling Cooperative Report 32.
- 2) Treatment 6 was originally a production thin (at 20m MCH) but was thinned in error at plot establishment, now equivalent to treatment 2.

APPENDIX 14

Experimental design for randomised incomplete block Silviculture/Breed Trials planted in 1987 at Ditchlings (FR11).
Each dot represents one large plot with a PSP 1/2).

Trt	Pruning Crown remaining	Silviculture				Planting stock					
		Stocking (stems/ha)		Thinning		Seedlings			Planting stock

6	4m	500	200	20	2.5:1	••	••	••	••	••	••

- 1) Forty eight PSP's established January 1993. Data available: Heights only, age 2, pruning measurements 1993, height and diameter annually from 1993.
PSP establishment and silviculture is documented in Stand Growth Modelling Cooperative Report 32.
- 2) Row plots of each stock type were established adjacent to the large block trial.
- 3) Plot abandoned in 1994 because of a spacing and mortality problem.
- 4) Plot abandoned in 1994 because trees close to power lines were required to be felled.

APPENDIX 15

Experimental design for randomised incomplete block Silviculture/Breed Trials planted in 1987 at Otago Coast (FR12).
Each dot represents one large plot with a PSP 1).

Trt	Pruning	Silviculture						Planting stock					
		Stocking (stems/ha)		Thinning				Seedlings		Planting stock

9	9	"	"	275	275	-	1:1	••		

- 1) Twenty two PSP's established December 1994. Data available: Heights only, age 2 , pruning measurements 1994, height and diameter annually from 1995.
- 2) This treatment was incorrectly documented in Report 24a as being pruned and thinned from 1500 to 500 stems/ha.
- 3) Original treatment numbers were reallocated, in December 1994, to a more logical sequence for establishing and numbering of PSP plots.

APPENDIX 18

Experimental design for randomised incomplete block Silviculture/Breed Trials planted in 1988 at Dalethorpe (FR56).
 Each dot represents one large plot with a PSP.¹⁾

Trt	Pruning	Silviculture				Planting stock					
		Stocking (stems/ha)		Thinning		Seedlings			Cuttings		
		Initial	Final	MCH	Ratio	GF14 (3/3/87/1) C	GF22 6/6/87/21) A	LI23 (GF9) (9/3/86/70) B	GF17 (9/0/83/96) D
