EXECUTIVE SUMMARY

Report Title: Screening current production lines of *Pinus radiata* for susceptibility to infection by *Phytophthora pluvialis*

Authors: Nari Williams, Natalie Graham, Mari Suontama and Martin Bader

The problem

To date, much of the screening for red needle cast has focussed on the RPBC Elite Clone series of plants; however, these are not representative of the clones in current production and mid-rotation. Information on the susceptibility of the current crop of *Pinus radiata* would be informative for disease risk assessments and management of established forests and immediate selection of the future crop.

This project

Screened *Pinus radiata* genotypes of industry relevance for susceptibility to infection by *Phytophthora pluvialis*.

Key Results

Quantitative differences in the susceptibility of *Pinus radiata* genotypes were observed.

Implications of Results for Client

The results of this study indicate a broad range in susceptibility/resistance of genotypes to red needle cast in New Zealand's current *Pinus radiata* production and breeding lines. This is promising for the potential to breed for improved resistance to RNC but suggests that a large portion of the established forest is likely to be at least moderately susceptible to red needle cast.

Further Work

This work should be further validated with observations of these genotypes in the field. Heritability, cross resistance analyses and implications for breeding and selection are being investigated further in conjunction with RPBC.

Screening current production lines of *Pinus radiata* for susceptibility to infection by *Phytophthora pluvialis*

Introduction

Phytophthora pluvialis is a pathogen of the needles of *Pinus radiata* that causes a disease known as red needle cast (RNC). It produces masses of sporangia on infected leaf tissues and causes the premature casting of *Pinus radiata* needles. A detached needle assay has been developed for screening *Pinus radiata* with *Phytophthora pluvialis* and applied to screening assays for identifying potential genetic resistance to RNC and assessing responses to chemical treatments for RNC control. To date, much of the screening for RNC has focussed on the RPBC Elite Clone series of plants; however, these are not representative of the clones in current production and mid-rotation. Information on the susceptibility of the current crop of *Pinus radiata* would be informative for disease risk assessments and management of established forests and immediate selection of the future crop.

Objective

To screen *Pinus radiata* genotypes of industry relevance for susceptibility to infection by *Phytophthora pluvialis*.

Materials and Methods

Plant material - *Pinus radiata* clones

Forty-four genotypes were screened from three sources. Eighteen grafted genotypes were sourced from ProSeed's Rangiora Nursery. The 'industry relevance' of the ProSeed genotypes was based on the experience and recommendation of Shaf van Ballekom from ProSeed using 2014 GF Plus values (Table). Twenty-two genotypes were sourced from the "Farm Field" cross-resistance trials and the remaining 8 from the RPBC Elite Clones.

Table 1: ProSeed genotypes screened in this trial showing the 2014 GF Plus Breeding Values.

Genotype	Gro	Str	Br	DR	WD	Cyc	PME	Relevance	Number of ramets tested

Inoculum preparation

Zoospore inoculum was prepared in accordance with Scion's standard protocol. In brief, isolates of *P. pluvialis* were grown on carrot agar at 17 °C for three days. Plugs of agar and mycelium were taken from the leading edge of the colonies, flooded with clarified carrot broth in flat bottom flasks and incubated for three days at 17 °C (Erwin and Ribeiro 1996). The resulting mycelial mats were rinsed thoroughly for 8 hours with deionised water, drained and flooded with 50 ml sterile pond water. These were incubated at 17 °C in the dark for a further three days before zoospore release was induced with 45 minute intervals at 4 °C in the dark then at room temperature (21-22 °C) on a light box. Zoospore concentrations were determined using a haemocytometer and standardised to 1×10^4 zoospores per ml with sterile pond water. Zoospore suspensions were used within two hours of preparation.

Detached needle assay

Twenty fascicles were collected from each plant with five fascicles assigned at random to two independent blocks (A and B) per treatment (H_2O and *P. pluvialis*-inoculated). Each tube was inoculated with either 4.5 ml of *P. pluvialis* zoospore suspension or sterile pond water overnight (18 hours). Fascicles were placed on trays moistened with wet paper towels and incubated in a controlled environment (17 °C, 65-70 % relative humidity, 14 h photoperiod) for 10 days. The needles within each fascicle were separated and lesion length measured.

Experimental Design

The experiment was set up as an alpha design with five super blocks (ramets) applying the inoculation treatment as whole-plot factor and the genotype ID as sub-plot factor. The data set comprises 4800 observations.

Statistical analysis

Linear mixed effects model (LMM) fitted by restricted maximum likelihood were used to analyse the aggregated lesion number (averaging across fascicles turned integers into decimal numbers) and lesion length data (R version 3.1.2, R Development Core Team 2015, R-package *nlme*, Pinheiro *et al.* 2015). The model contained inoculation treatment, genotype identity, and their interaction as fixed effects. The nested random term consisted of 'tray' nested in 'ramet', reflecting the alpha design.

The significance of the fixed terms was assessed by comparing fitted models based on likelihood ratio tests (Zuur *et al.* 2009). Graphical model validation tools were used to test the underlying assumptions of variance homogeneity and normality (plots of standardised residuals vs. fitted values and against all explanatory variables to evaluate variance patterns, quantile-quantile plots to assess the normality criterion). The data showed strong heteroscedasticity. In the case of the lesion length data, this heteroscedastic variance pattern was modelled using a constant variance structure (*varIdent*, using the inoculation treatment as grouping factor allowing for stratified variance modeling in the control and *P. pluvialis*-infected groups. For the lesion number data, a combined variance structure was applied, comprising a constant variance structure (*varIdentl*, using the inoculation treatment as grouping factor) and an exponential variance structure (*varExp*, using the fitted values as variance covariate).

For both models, the significant inoculation × genotype ID interaction was followed up applying a multiple comparison procedure using Tukey contrasts (R-package *multcomp*, Hothorn *et al.* 2008). No pedigree information was overlayed in the analysis, and the lesion means were not adjusted for the genetics of the individuals.

Results

Lesion length

As anticipated, significantly larger lesions occurred in plant material inoculated with *Phytophthora pluvialis* compared to the controls (significant inoculation × genotype ID interaction, Table 2 and Table 3, Fig. 1). Quantitative differences were observed between genotypes with low experimental variation, providing confidence in the assessment of relative differences in susceptibility between genotypes (Appendix 1).

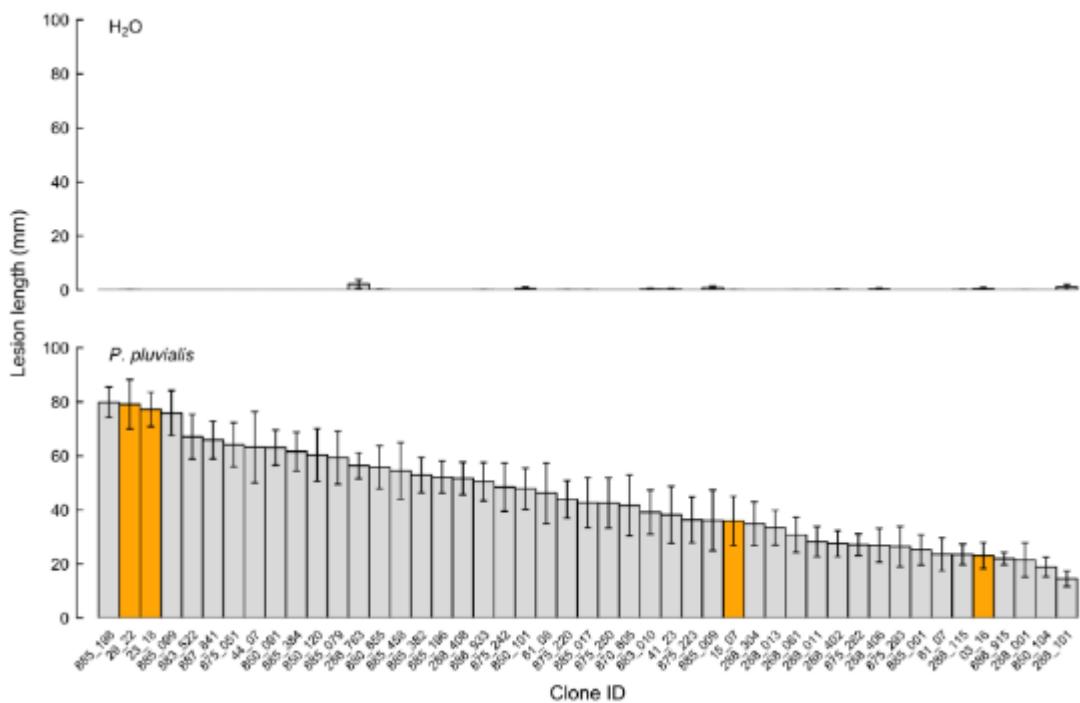

Fig. 1 Average lesion length per fascicle in *Pinus radiata* needles from 47 genotypes that were either un-inoculated (H₂O control, upper panel) or inoculated with *Phytophthora pluvialis* (lower panel). Orange filled bars indicate the four reference clones.

Table 2: Results from model comparison applied to lesion length to arrive at the most parsimonious model. Starting with highest interaction, each term is dropped in turn and the respective models are compared using the AIC and likelihood ratio tests until only significant terms remain in the model. Inoc = inoculation treatment, clone = clone ID. AIC = Akaike's Information Criterion, logLik = log Likelihood, L = Likelihood ratio, DF = Degrees of freedom of the L statistic, P = P -value.

genotype	46	785	1.43	0.034 *
Inoc × genotype	46	785	5.32	< 0.001 ***

Lesion number

As anticipated, significantly more lesions occurred in plant material inoculated with *Phytophthora pluvialis* compared to the controls (significant inoculation \times genotype ID interaction, Table 4 and 5, Fig. 2). Appendix 2 gives the results of a multiple comparison procedure contrasting genotypes.

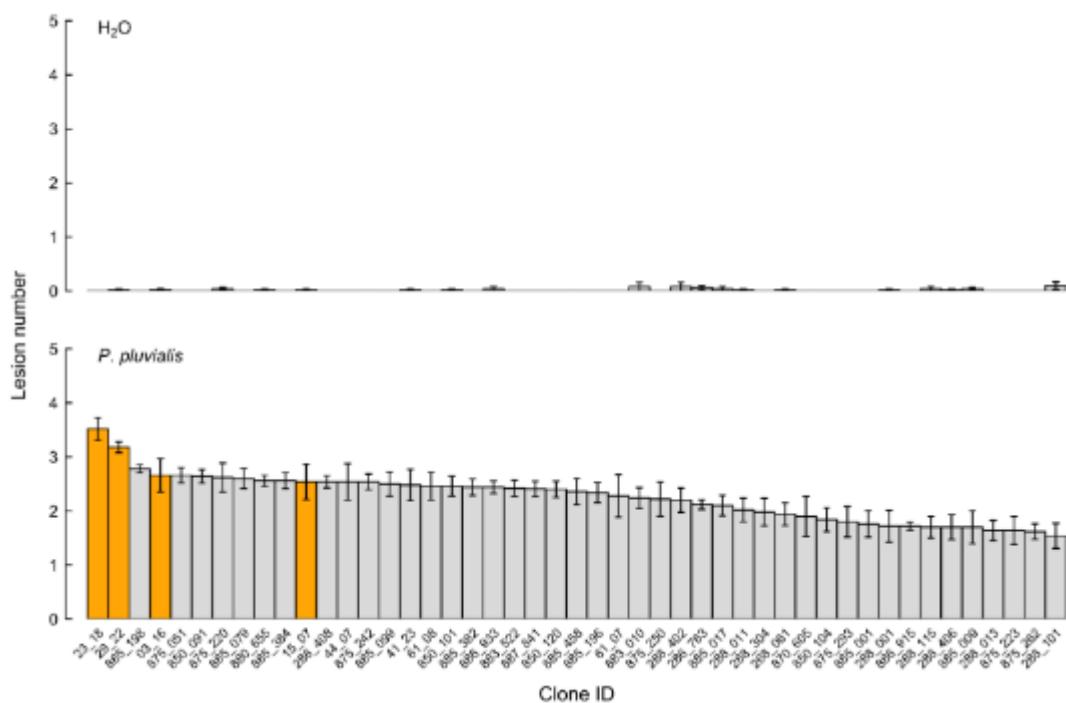

Fig. 2 Average lesion number per fascicle in *Pinus radiata* needles from 47 genotypes that were either un-inoculated (H₂O control, upper panel) or inoculated with *Phytophthora pluvialis* (lower panel). Orange filled bars indicate the four reference clones.

Table 4: Results from model comparison applied to lesion number to arrive at the most parsimonious model. Starting with highest interaction, each term is dropped in turn and the respective models are compared using the AIC and likelihood ratio tests until only significant terms remain in the model. Inoc = inoculation treatment, clone = clone ID.

Discussion

The results of this study indicate a broad range in susceptibility/resistance of genotypes to red needle cast in New Zealand's current *Pinus radiata* production and breeding lines. This indicates a range of disease vulnerability in the current established forest which may be attributed to genetic factors. Lesion formation on the four reference clones demonstrate that the assay was successful with quantitative differences in the tested lines ranging across these reference clones. With some seasonal variation observed between assay runs, reference clone 29_22 most frequently has above average lesion lengths while the remaining reference clones have had moderate lesion formation across repeated trials (Graham N, Williams N et al. 2015). In relation to these reference clones, the majority of genotypes screened showed moderate susceptibility to *P. pluvialis* infection. Genotypes with lesion lengths below the reference clones (886-915, 288-001, 850-104 and 288-101) are likely to have low susceptibility in repeat assays. Similarly, genotypes 885-198, 885-099, 883-522 and 887-841 have shown low resistance to *P. pluvialis* infection. The later of these (887-841) having been identified in early RNC trials to be susceptible to the disease (Dick, Williams et al. 2014).

This study extends the application of screening for red needle cast to genotypes and breeding families in mid rotation and being deployed for planting by the industry. The preliminary results presented here provide a basis for back-testing resistance markers identified in the other components of the HTHF programme against clones of industry relevance later in the programme.

This work should be further validated with observations of these genotypes and progeny of these genotypes in the field. Heritability, cross-resistance analyses and implications for breeding and selection are being investigated further in conjunction with RPBC.

Acknowledgements

This work was funded by MBIE (CO4X1305), the Forest Growers Levy Trust (Administered by the Forest Owners Association) and the Radiata Pine Breeding Company. *Pinus radiata* clonal material was sourced from the Radiata Pine Breeding Company and maintained by Scion's nursery. Inoculation trials were run by the Forest Protection staff led by Catherine Banham and Shannon Hunter.
